

Pump It Up

Data Mining the Water Table
Presented By:
Morgan Jones

Problem Statement

The United Republic of Tanzania Ministry of Water

Mission

To improve access to safe drinking water and sanitation services to all, and manage water resources so as to ensure national food security and sustainable industrial based economic development.

OUR GOALS

Analysis

Discover valuable insights to share with Ministry of Water to achieve their mission

Accuracy

Generate a model with > 0.80 accuracy in predicting functionality

Precision

Lowest value of false positives: model predicting a well is functional when it is not

OUR OSEMiN PROCESS

Obtain

...

Import the data

Scrub

...

Manage datatypes,
resolve
missing/duplicate
values

Explore

...

Find patterns
among the
relationships of
variables in the
dataset

Model

...

Create predictive
models

iNterpret

...

Identify insights and
visualize findings

OUR DATA

Target

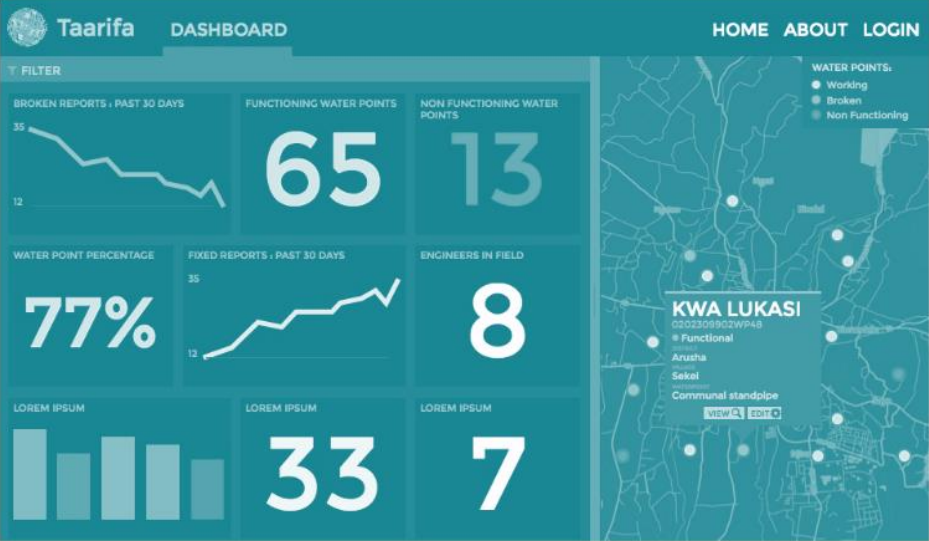

Functional 54%

Non-Functional 38.4%

Functional needs Repair 7.2%

Key Features

COORDINATES

ELEVATION

CONSTRUCTION YEAR

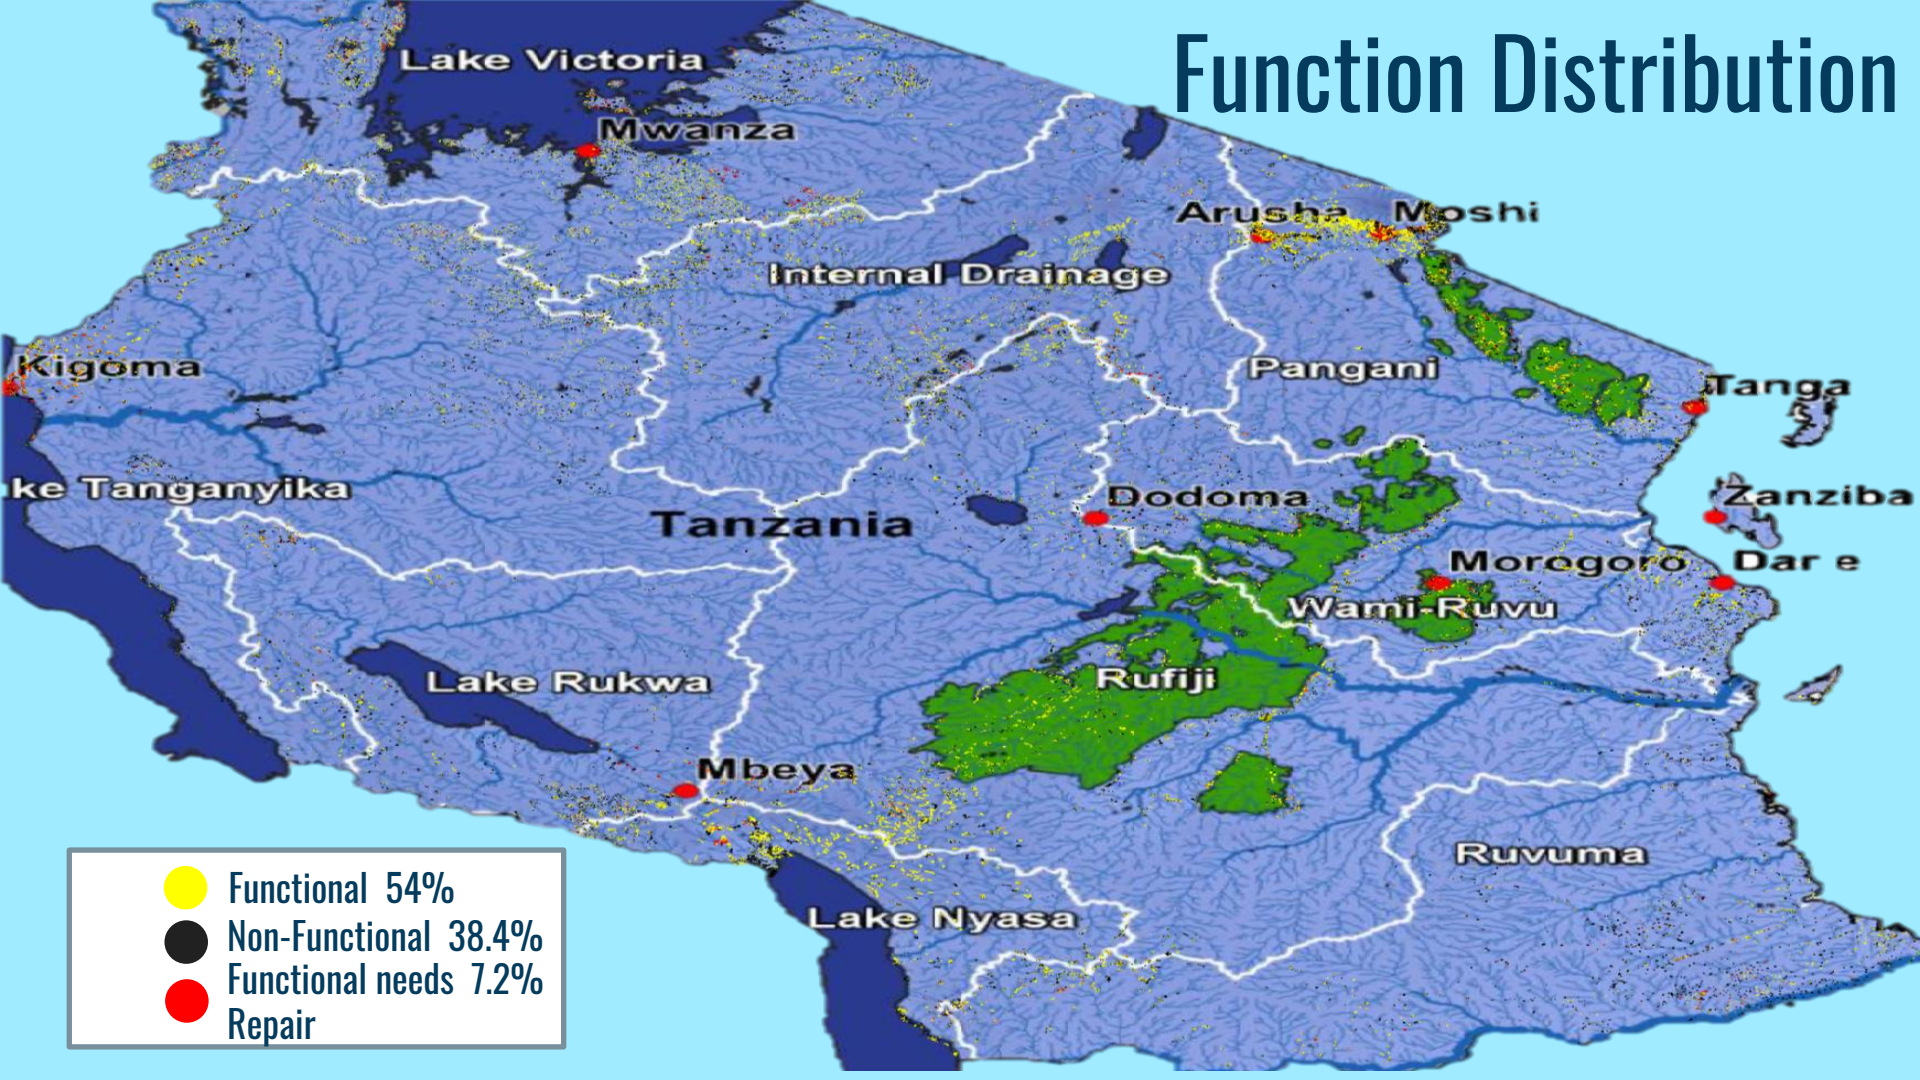

Amount of Water Available

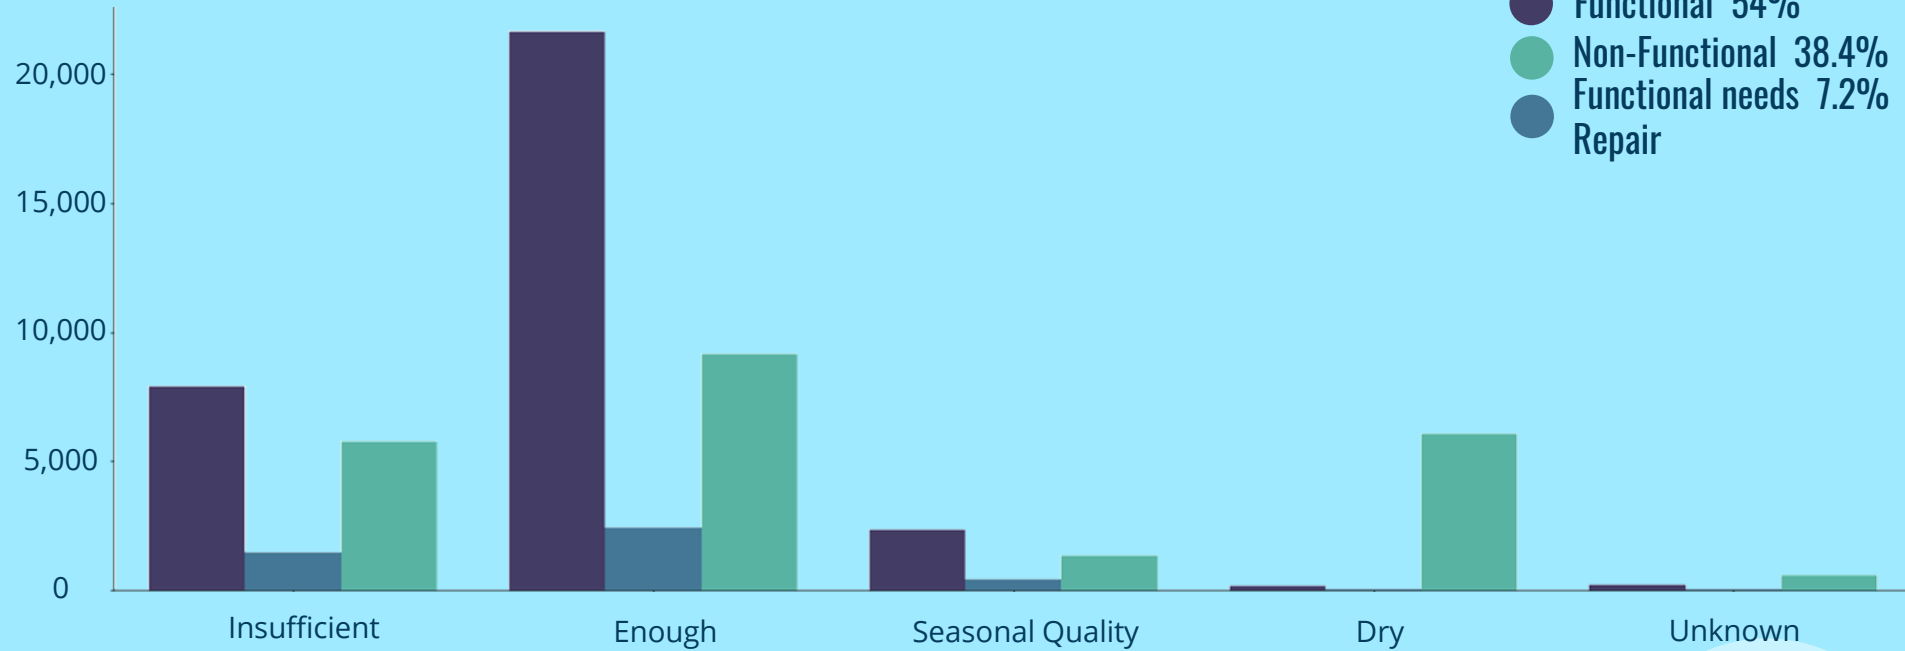

59400 Water Points
40 Descriptors

Function Distribution

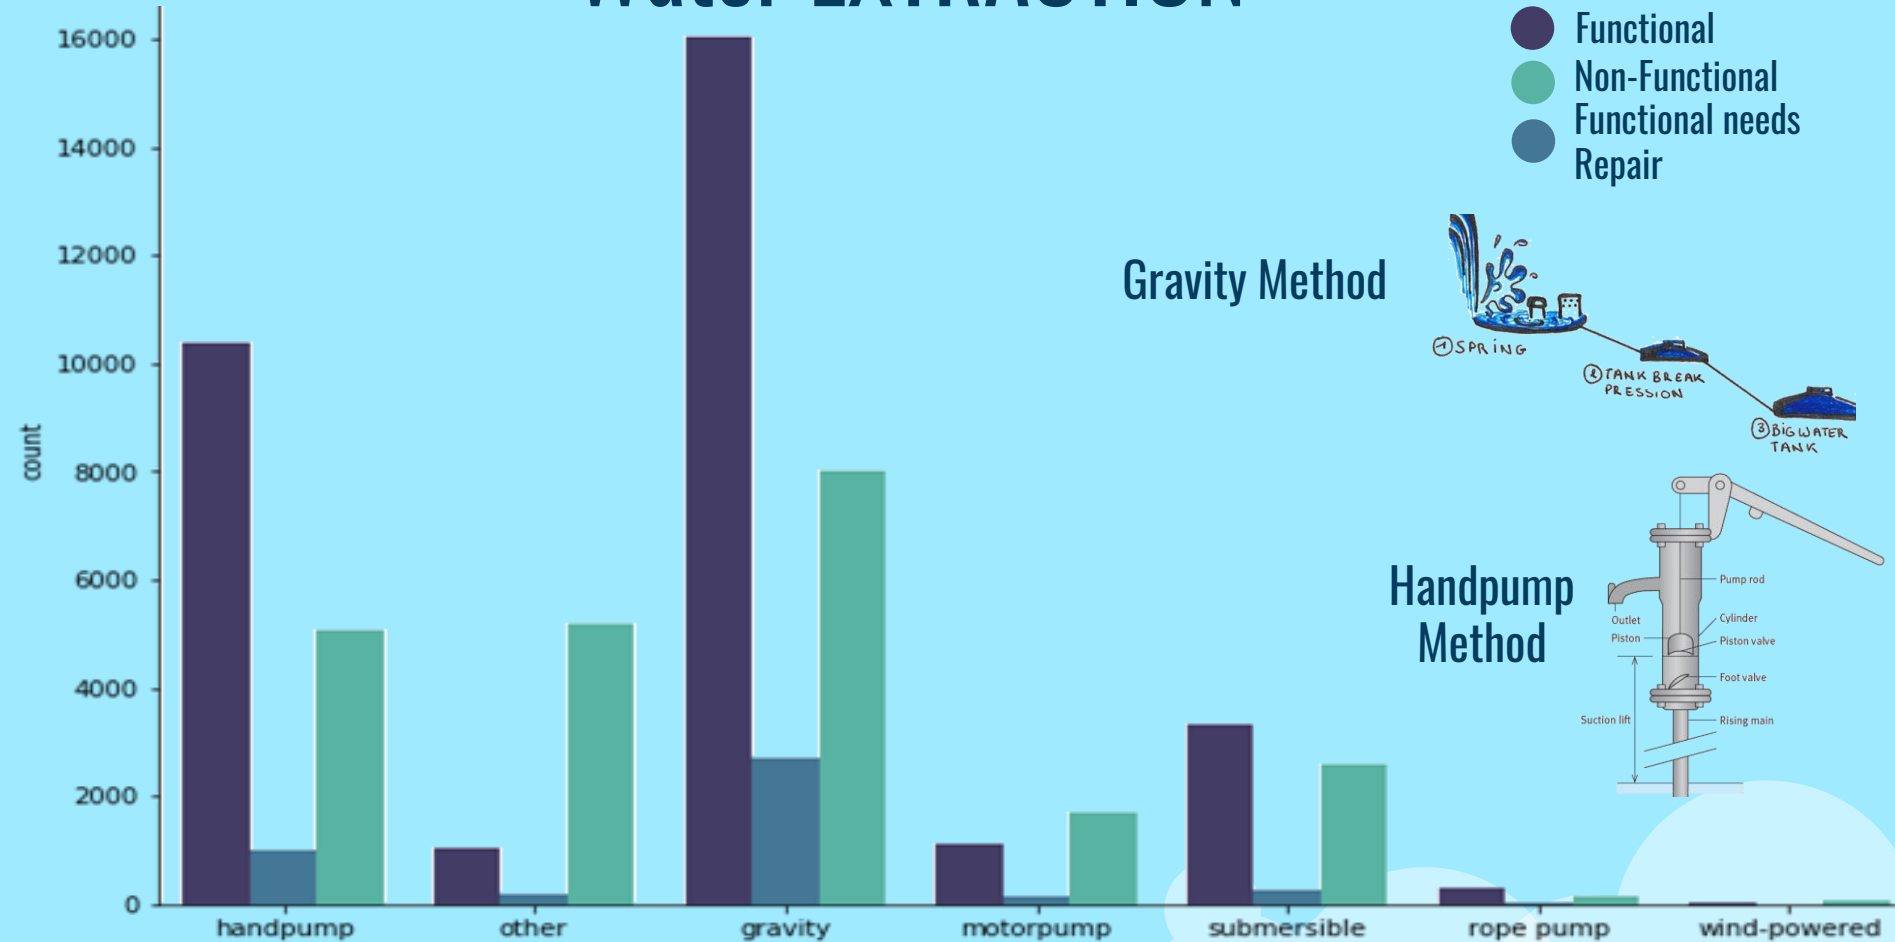

Water QUANTITY

Water in Liters

Water EXTRACTION

POPULATION per WELL Distribution by REGION

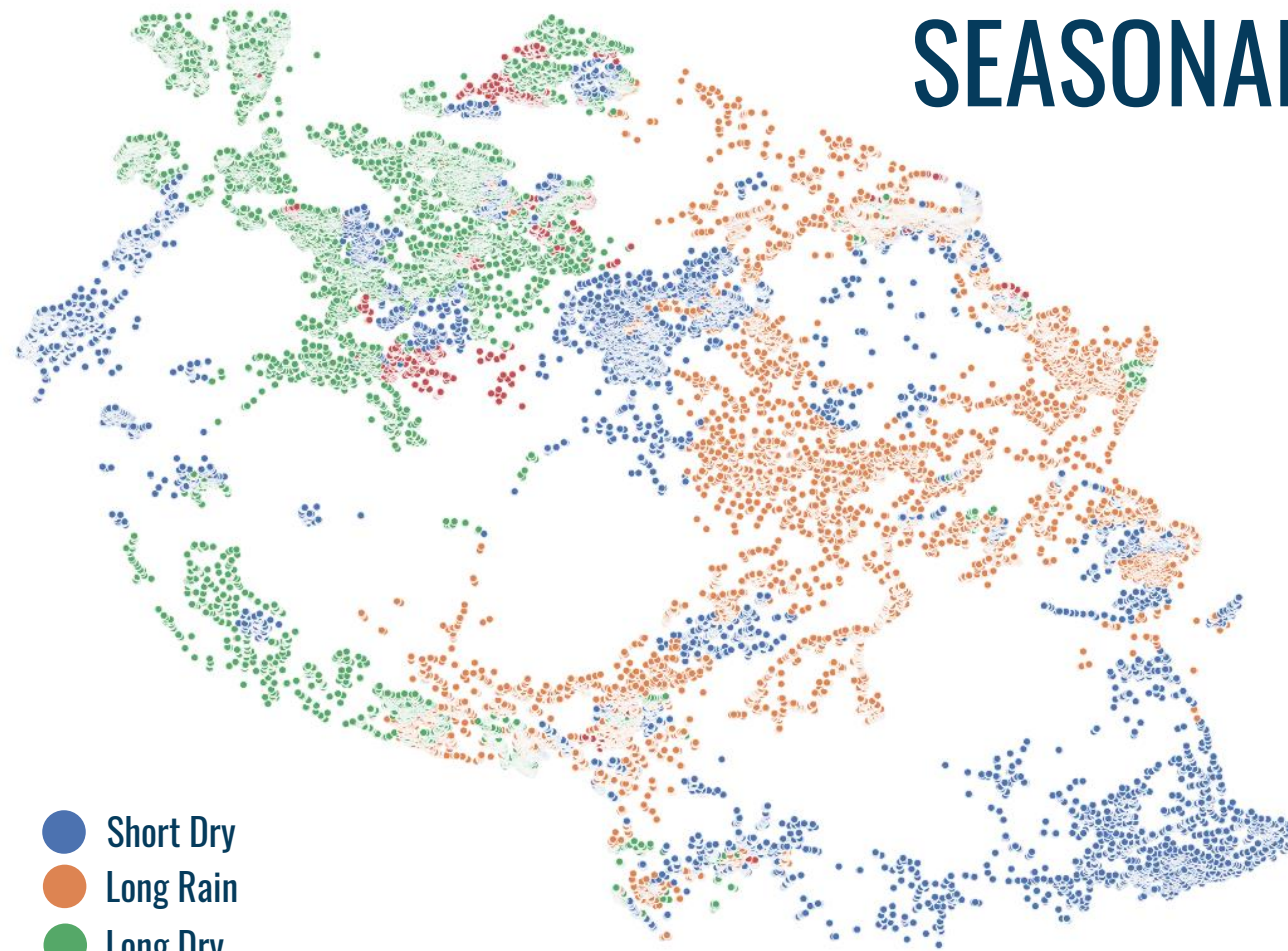

POPULATION per WELL

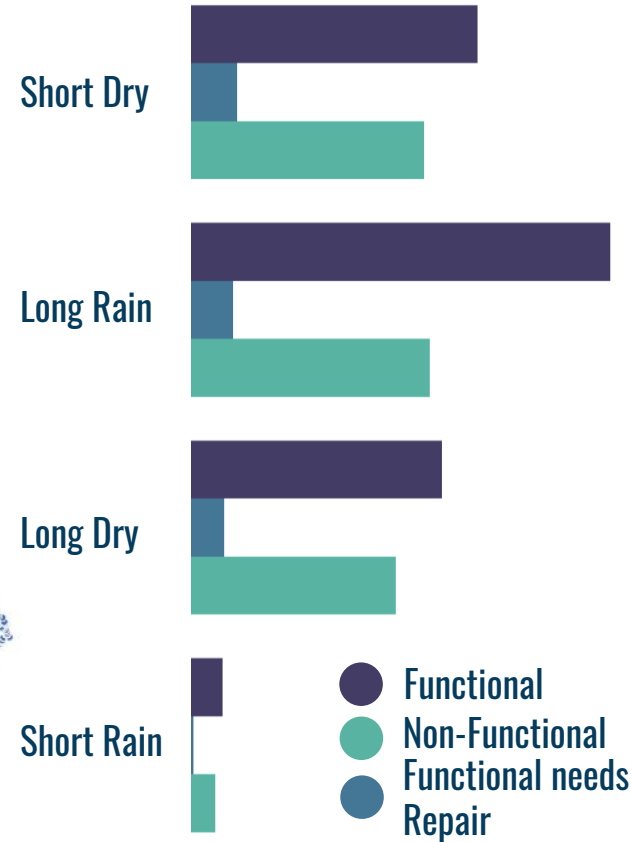

CONSTRUCTION YEAR distribution

SEASONALITY distribution

- Short Dry
- Long Rain
- Long Dry
- Short Rain

OUR MODEL ACCURACY

OUR RANDOM FOREST CLASSIFIER PERFORMANCE

ACCURACY

The best performing model was our Random Forest classifier which accurately predicts functionality 80 of 100 predictions

FALSE POSITIVES

On average for every 100 non-functioning waterpoints, our model would predict 20 as functioning.

OUR RECOMMENDATIONS

Gravity and Handpump wells are the simplest, and most common well type. Build teams experienced in repair and maintenance of these well types.

Maintenance Specialities

Population per well is important when keeping wear on wells low. Install more wells in those areas with higher populations to increase well longevity.

Population Use Analysis

There is a seasonal pattern to report creation. Locating repair teams in the North West regions during the long dry season, and in the East during the long rain could shorten repair times.

Seasonal Awareness

OUR FUTURE WORK

MORE DATA ● ● ●

Collecting more data, and increasing usage of TAARIFA would improve predictability of models

INCREASE COMPLEXITY ● ● ●

Neural Networks and Quantum Based Classifiers could improve predictive performances for the ministry to get clean water accessible to more citizens

COMPUTER VISION ● ● ●

Investment in Drones with Computer Vision models designed to find visual patterns of functionality could greatly increase predictive performance
